THE PROJECT

Setting up of an experimental H&DL product/process development line or "Hybrid, alternative energy & Development line". This is a world first in the industrial vehicle field. The aim is to prepare future ranges of "clean" trucks by meeting the environmental requirements of the Euro 5 and then the Euro 6 standards. This tool will bring great flexibility to allow more frequent product renewal (innovations in areas such as safety, reliability, fuel consumption reduction, design, driving comfort) as well as enabling significant progress in the research work ongoing in this area. The project will be spread over 4 years and will contribute to the development of design and organisation models for tomorrow's assembly lines.
