THE PROJECT

The project proposes a set of methods and technologies to optimise production, from the creation of educational content through to assistance with delivery.

The objective of the project is to produce an Educational Engineering Workshop which provides an original solution meeting a need that exists on the market. It involves exploiting an enterprise's processes to assess and optimise the training delivery support tools (ITS, Mobility, AR). The project will lead to the creation of demonstrators which will measure the contribution of the different technologies.
